# Chapter 1. Foundations of Attention

Attention is not a single faculty but a family of mechanisms that select among competing inputs. This chapter introduces the vocabulary used throughout the book and distinguishes sustained attention from selective attention. The distinction matters because the two respond differently to training, and a method that improves one may leave the other untouched.

# Chapter 2. Reading and Working Memory

Reading a long narrative requires the reader to hold a situation model in working memory across hours of elapsed time. We review the evidence that such models degrade predictably with time away from the text, and we consider what follows for the design of reading tools.

# Chapter 3. Measuring Engagement

Self-report and behavioural measures of engagement often disagree. This chapter sets out the instruments used in the studies that follow, including the vividness of visual imagery questionnaire and a simple comprehension checkpoint with known reliability.
